

**Briefly explain the two types of Angular Forms.**

- Template-driven form: visual part of a component with basic interactives such as interpolation, binding, directives.
- Reactive form: more complex than template since it's a model-driven, where the model will be the source for an update

**What does data-binding in Angular allow you to do?**

As its name suggests, data-binding is a method to bind what users see in a browser with required sources or action. There many forms of data binding such as one-way binding and double binding.

**What is interpolation?**

One of one-way data-binding types that connects an element on an HTML with a component and works with strings and values.
